Q1. Complete the code below to remove the troublesome first column from `countData`

```
countData <- as.matrix(countData[,-1])
head(countData)

Q2. Complete the code below to filter `countData` to exclude genes (i.e. rows) where we have 0 read count across all samples (i.e. columns).

```

We will get the results for the HoxA1 knockdown versus siRNA

```
res = results(dds, contrast=c("condition", "hoxa1_kd", "control_siRNA"))
```

Q3. Call the `summary()` function on your results to get a sense of how many genes are up or down-regulated at the default 0.1 p-value cutoff.

```
summary(res)
```

```

Now we will form the volcano plot

```
plot( res$log2FoldChange, -log(res$padj) )
```

Q4. Improve this plot by completing the below code, which adds color and axis labels

```

# Make a color vector for all genes
mycols <- rep("gray", nrow(res) )

# Color red the genes with absolute fold change above 2
mycols[ abs(res$log2FoldChange) > 2 ] <- "red"

# Color blue those with adjusted p-value less than 0.01
# and absolute fold change more than 2
inds <- (abs(res$pvalue) < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

plot( res$log2FoldChange, -log(res$padj), col=mycols, xlab="Log2(FoldChange)", ylab="-Log(

```

We will now add gene annotation

Q5. Use the `mapIDs()` function multiple times to add SYMBOL, ENTREZID and GENE-NAME annotation to our results by completing the code below.

Q6. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

Pathway Analysis

First we are going to install the GAGE package and then apply it for pathway analysis.

```
#BiocManager::install( c("pathview", "gage", "gageData") )
```

We will start by loading the packages

```
library(pathview)
